No Work = No Credit

Name: \_\_\_\_\_ Student Number: \_\_\_\_\_

1. (5 points) Compute  $\int_{-1}^1 x \, dx$ . *Show all your steps.*

**Solution:**

To answer this question, we'll use our three step method for computing the definite integral  $\int_a^b f(x)dx$ :

1. Find  $a$  and  $b$ .
2. Find an antiderivative  $F(x)$  for  $f(x)$ .
3. Compute  $F(b) - F(a)$ .

Implementing these steps:

1. We can read off from the question that  $a = -1$  and  $b = 1$ .
2. We'll find the family of antiderivatives  $\int x \, dx$ :

$$\int x \, dx$$

Using the power rule, we get:

$$\frac{x^2}{2} + C$$

where  $C$  is an arbitrary constant.

Since we only need one antiderivative, we can choose the constant  $C$  as we please. A good candidate is to set  $C = 0$ , since then we have one fewer term to deal with.

Name: \_\_\_\_\_ Student Number: \_\_\_\_\_

So, we get an antiderivative  $F(x) = \frac{x^2}{2}$ .

3. Lastly, we compute:

$$F(b) - F(a)$$

$$F(x)|_b - F(x)|_a$$

$$\left(\frac{x^2}{2}\right)|_b - \left(\frac{x^2}{2}\right)|_a$$

$$\left(\frac{x^2}{2}\right)|_1 - \left(\frac{x^2}{2}\right)|_{-1}$$

$$\left(\frac{(1)^2}{2}\right) - \left(\frac{(-1)^2}{2}\right)$$

$$\left(\frac{1}{2}\right) - \left(\frac{1}{2}\right)$$

$$= 0.$$

Notice that the answer is 0!

This may seem strange, since the area between the graph of  $y = x$  and the  $x$ -axis over the interval  $[-1, 1]$  is clearly not zero. The actual area can be found by adding two triangles: the first triangle is the triangle between the line  $y = x$  and the  $x$ -axis over the interval  $[-1, 0]$ , and the second triangle is the triangle between the line  $y = x$  and the  $x$ -axis over the interval  $[0, 1]$ . These two triangles are actually equal, and each has area  $\frac{1}{2} * \text{base} * \text{height} = \frac{1}{2} * (1) * (1) = \frac{1}{2}$ . So, the total area should be  $\frac{1}{2} + \frac{1}{2} = 1$ .

This example illustrates the fact that the definite integral is an *oriented* measure of area: since the first triangle lies below the  $x$ -axis, it is counted as a *negative* area, equal to  $-\frac{1}{2}$ . So, the definite integral adds up the areas as  $-\frac{1}{2} + \frac{1}{2} = 0$  and the triangles "cancel out".
